Highly Pathogenic Avian Influenza (HPAI) Update

To: California Organic Certifiers

Over the past couple of months, California has not had any detections of HPAI in commercial/backyard poultry flocks and minimal detections in wildlife. California met the criteria to self-declare free from HPAI in poultry on April 17, 2026. At this time, we feel it is safe to allow outdoor access for poultry (as required for organic certification) with proper biosecurity measures in place. If possible, the use of netting or barriers for producers to prevent their birds from interacting with wild birds is highly encouraged. This action is particularly important if there is ANY water in the vicinity that may attract and congregate wild waterfowl. The risk of disease entering domestic poultry flocks is always present.

We will continue to monitor the situation and will reach out again if we feel there is an increased threat.

If you have any questions, please do not hesitate to contact me directly. Thank you for your cooperation.
