\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-209. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

<sup>5</sup> Reduced Exp. - No Residue to Water, 10% to Native Soil assumes there is no natural surface water sufficiently close to the site of application for run-off from the site, and the 10% soil residues are available to plants for systemic uptake.

Table ACP-Eco-214. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-223. Chronic RQs associated with Application Scenario ACP-15-08: Combination of Marathon II Greenhouse & Nursery Insecticide as a drench application at 5.26 lb a.i./Acre and Baythroid XL as a foliar application at 0.025 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 100% of the applied chemical is assumed to reach native soil.

<sup>2</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>3</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product.

Table ACP-Eco-238. Acute RQs associated with Application Scenario ACP-12-26: Combination of Flagship 25WG as a drench application at 0.1225 lb a.i./Acre and Tombstone as a foliar application at 0.05 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 100% of the applied chemical is assumed to reach native soil.

<sup>2</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-243. Chronic RQs associated with Application Scenario ACP-12-09: Combination of Flagship 25WG as a drench application at 0.1225 lb a.i./Acre and Baythroid XL as a foliar application at 0.025 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-247. Acute RQs associated with Application Scenario ACP-21-11: Combination of Safari 20 SG as a drench application at 10.21 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-250. Chronic RQs associated with Application Scenario ACP-20-10: Combination of Safari 20 SG as a drench application at 10.21 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-259. Chronic RQs associated with Application Scenario ACP-21-11: Combination of Safari 20 SG as a drench application at 10.21 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-263. Acute RQs associated with Application Scenario ACP-03-11: Combination of Admire Pro as a drench application at 7.96 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-266. Acute RQs associated with Application Scenario ACP-06-11: Combination of Alias 2F as a drench application at 5.19 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 30 acres to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-269. Acute RQs associated with Application Scenario ACP-15-10: Combination of Marathon II Greenhouse & Nursery Insecticide as a drench application at 5.26 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-272. Acute RQs associated with Application Scenario ACP-30-11: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-275. Chronic RQs associated with Application Scenario ACP-01-10: Combination of Admire Pro as a drench application at 5.89 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-278. Chronic RQs associated with Application Scenario ACP-04-10: Combination of Admire Pro as a drench application at 7.96 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-285. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-288. Chronic RQs associated with Application Scenario ACP-32-10: Combination of Nuprid 4.6F Pro as a drench application at 5.89 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-292. Chronic RQs associated with Application Scenario ACP-04-10: Combination of Admire Pro as a drench application at 7.96 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating an Area Use Factor (AUF).

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-297. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-303. Chronic RQs associated with Application Scenario ACP-01-10: Combination of Admire Pro as a drench application at 5.89 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-307. Chronic RQs associated with Application Scenario ACP-05-10: Combination of Alias 2F as a drench application at 5.19 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-312. Chronic RQs associated with Application Scenario ACP-28-10: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-316. Chronic RQs associated with Application Scenario ACP-32-10: Combination of Nuprid 4.6F Pro as a drench application at 5.89 lb a.i./Acre and Danitol 2.4 EC Spray as a foliar application at 0.4 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 100% of the applied chemical is assumed to reach native soil.

<sup>2</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-321. Acute RQs associated with Application Scenario ACP-19-18: Combination of Safari 20 SG as a drench application at 10.21 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-329. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-334. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-338. Acute RQs associated with Application Scenario ACP-02-17: Combination of Admire Pro as a drench application at 5.89 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-342. Acute RQs associated with Application Scenario ACP-06-13: Combination of Alias 2F as a drench application at 5.19 lb a.i./Acre and Kontos as a foliar application at 0.125 lb a.i./Acre to 30 acres to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

Table ACP-Eco-345. Acute RQs associated with Application Scenario ACP-07-17: Combination of Alias 2F as a drench application at 5.19 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-349. Acute RQs associated with Application Scenario ACP-29-13: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Kontos as a foliar application at 0.125 lb a.i./Acre to 30 acres to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-352. Acute RQs associated with Application Scenario ACP-30-17: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-362. Chronic RQs associated with Application Scenario ACP-07-13: Combination of Alias 2F as a drench application at 5.19 lb a.i./Acre and Kontos as a foliar application at 0.125 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-366. Chronic RQs associated with Application Scenario ACP-28-18: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

<sup>5</sup> Reduced Exp. - No Residue to Water, 10% to Native Soil assumes there is no natural surface water sufficiently close to the site of application for run-off from the site, and the 10% soil residues are available to plants for systemic uptake.

Table ACP-Eco-369. Chronic RQs associated with Application Scenario ACP-30-13: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Kontos as a foliar application at 0.125 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-370. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-373. Chronic RQs associated with Application Scenario ACP-01-18: Combination of Admire Pro as a drench application at 5.89 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating an Area Use Factor (AUF).

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-384. Chronic RQs associated with Application Scenario ACP-28-18: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating an Area Use Factor (AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-390. \* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-395. Chronic RQs associated with Application Scenario ACP-05-18: Combination of Alias 2F as a drench application at 5.19 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-400. Chronic RQs associated with Application Scenario ACP-14-17: Combination of Marathon II Greenhouse & Nursery Insecticide as a drench application at 5.26 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. Of the drench-applied product, 100% of the chemical available for uptake to plants. No chemical residues move from the application site to water.

<sup>2</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot.

<sup>3</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

<sup>5</sup> Reduced Exp. - No Residue to Water, 10% to Native Soil assumes there is no natural surface water sufficiently close to the site of application for run-off from the site, and the 10% soil residues are available to plants for systemic uptake.

Table ACP-Eco-405. Chronic RQs associated with Application Scenario ACP-30-13: Combination of Widow as a drench application at 5.19 lb a.i./Acre and Kontos as a foliar application at 0.125 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water or adjacent habitat. Of the drench-applied product, 100% of the applied chemical is assumed to reach native soil.

<sup>2</sup> Reduced Exp.-Combo, 25 ft. Drift Buffer to Water and Habitat assumes 10% of soil treatment and reduced foliar spray estimated for 25 ft. to surface water and terrestrial habitats.

<sup>3</sup> Combination Foliar and Drench App. No drift buffer is modeled between the application site and water. Of the drench-applied product, 100% of the applied chemical is assumed to reach native soil.

<sup>4</sup> Combination Foliar and Drench App. No chemical residue moves from the application site to water. A 25 ft. drift buffer is modeled between the application site and adjacent habitat for the foliar-applied product. Of the drench-applied product, 10% of the applied chemical is assumed to reach native soil from leaching out of the pot or overspray of the pot, with the exception of applications of Flagship 25 WG. For application of Flagship 25 WG, 100% of the applied chemical is assumed to reach native soil.

Table ACP-Eco-410. Chronic RQs associated with Application Scenario ACP-12-17: Combination of Flagship 25WG as a drench application at 0.1225 lb a.i./Acre and Movento as a foliar application at 0.156 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants in the nursery production area without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-30. Chronic RQs associated with Application Scenario PDCP-09: Aerial spray applications of Assail 70 WP at 0.0875 lb a.i./Acre to 20 acres in production citrus without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-35. Chronic RQs associated with Application Scenario PDCP-59: Ground spray applications of Tristar 30 SG at 0.0506 lb a.i./Acre to 15 acres in a residential setting without incorporating an Area Use Factor (No AUF).

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-39. Chronic RQs associated with Application Scenario PDCP-06: Ground spray applications of Assail 30 SG at 0.13125 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating an Area Use Factor (AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-50. Chronic RQs associated with Application Scenario PDCP-49: Ground spray applications of Talstar S Select at 0.1042 lb a.i./Acre to 0.75 acres to nursery stock plants without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-54. Chronic RQs associated with Application Scenario PDCP-49: Ground spray applications of Talstar S Select at 0.1042 lb a.i./Acre to 0.75 acres to nursery stock plants incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-78. Chronic RQs associated with Application Scenario PDCP-31: Ground spray applications of Lorsban 4E at 3.5 lb a.i./Acre to 0.75 acres to nursery stock plants without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-81. Chronic RQs associated with Application Scenario PDCP-30: Ground spray applications of Lorsban 4E at 3.5 lb a.i./Acre to 3750 ft.<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating an Area Use Factor (AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-93. Acute RQs associated with Application Scenario PDCP-25: Aerial applications of Discus at 0.0121 lb a.i./Acre of cyfluthrin and 0.51 lb a.i./Acre of imidicloprid to 130 acres of nursery stock plants.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

- <sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.
- <sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.
- <sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes 25-ft. drift buffer exists between surface water and application site, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.
- <sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.
- <sup>5</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.
- <sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes 25-ft. drift buffer exists between surface water and application site, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-138. Chronic RQs associated with Application Scenario PDCP-20: Airblast applications of Danitol 2.4 EC Spray at 0.3999 lb a.i./Acre to 20 acres of citrus trees without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-146. Chronic RQs associated with Application Scenario PDCP-51: Ground spray applications of Tame 2.4 EC Spray at 0.1875 lb a.i./Acre to 0.75 acres of nursery stock plants incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-154. Acute RQs associated with Application Scenario PDCP-42: Ground spray applications of Quali-Pro Imidacloprid 2F at 0.0266 lb a.i./Acre to 0.75 acres to nursery stock plants.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- Drench, 10% to Native Soil assumes drench application is made to potted plants and 10% leaches from pot or reaches native soil from overspray of the pot and no buffer exists between application site and surface water.

<sup>2</sup> Baseline- Drench, 100% to Native Soil assumes drench application is to native soil and no buffer exists between application site and surface water.

<sup>3</sup> A drench application with 100% of the applied chemical assumed to reach native soil. No chemical residues move from the application site to water.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to 10% to Native Soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- Drench, 10% to Native Soil assumes drench application is made to potted plants and 10% leaches from pot or reaches native soil from overspray of the pot and no buffer exists between application site and surface water.

<sup>2</sup> Baseline- Drench, 100% to Native Soil assumes drench application is to native soil and no buffer exists between application site and surface water.

<sup>3</sup> A drench application with 100% of the applied chemical assumed to reach native soil. No chemical residues move from the application site to water.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to 10% to Native Soil.

Table PDCP-Eco-162. Chronic RQs associated with Application Scenario PDCP-41: Ground spray applications of Quali-Pro Imidacloprid 2F at 0.0266 lb a.i./Acre to 3750 ft<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- Drench, 10% to Native Soil assumes drench application is made to potted plants and 10% leaches from pot or reaches native soil from overspray of the pot and no buffer exists between application site and surface water.

<sup>2</sup> Baseline- Drench, 100% to Native Soil assumes drench application is to native soil and no buffer exists between application site and surface water.

<sup>3</sup> A drench application with 100% of the applied chemical assumed to reach native soil. No chemical residues move from the application site to water.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to 10% to Native Soil.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- Drench, 10% to Native Soil assumes drench application is made to potted plants and 10% leaches from pot or reaches native soil from overspray of the pot and no buffer exists between application site and surface water.

<sup>2</sup> Baseline- Drench, 100% to Native Soil assumes drench application is to native soil and no buffer exists between application site and surface water.

<sup>3</sup> A drench application with 100% of the applied chemical assumed to reach native soil. No chemical residues move from the application site to water.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to 10% to Native Soil.

Table PDCP-Eco-173. Chronic RQs associated with Application Scenario PDCP-02: Soil injection of Alias 4F at 5.12 lb a.i./Acre to 130 acres to nursery stock plants incorporating a Mid-Point Area Use Factor (Mid-Point AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-200. Chronic RQs associated with Application Scenario PDCP-40: Airblast sprayer applications of PyGanic Crop Protection EC 1.4 at 0.049 lb a.i./Acre to 20 acres to production citrus without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-204. Acute RQs associated with Application Scenario PDCP-33: Ground spray applications of Mavrik Aquaflo at 0.34 lb a.i./Acre to 3750 ft<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes the terrestrial receptors receive exposure to the full application rate and no buffer exists between application site and surface water.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes 25 ft. buffer exists between surface water and the application site, and terrestrial receptors are exposed to the full application rate.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes no buffer exists between application site and surface water, and terrestrial receptors are exposed to residues that drift to an area 25 ft. from the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes there is no water near enough for run-off from the site, and terrestrial receptors are exposed to the full application rate.

Table PDCP-Eco-208. Chronic RQs associated with Application Scenario PDCP-33: Ground spray applications of Mavrik Aquaflow at 0.34 lb a.i./Acre to 3750 ft<sup>2</sup> to plants immediately prior to shipping on a nursery loading dock incorporating an Area Use Factor (AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 100 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>5</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

Table EGVM-Eco-2. Chronic RQs associated with Application Scenario EGVM-04: Foliar applications of DuPont Acelepryn at 0.20875 lb a.i./Acre to 7500 sq. ft. in a nursery without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 100 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>5</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

Table LBAM-Eco-2. Chronic RQs associated with Application Scenario LBAM-04: Foliar applications of DuPont Acelepryn at 0.0261 lb a.i./Acre to 10 acres in small, medium, and most large nurseries without incorporating an Area Use Factor (No AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 100 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>4</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>5</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

Table LBAM-Eco-5. Acute RQs associated with Application Scenario LBAM-07: Foliar applications of Scimitar GC at 0.0344 lb a.i./Acre to 10 acres in a small, medium, and most large nurseries.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

Table LBAM-Eco-17. Chronic RQs associated with Application Scenario LBAM-01: Foliar applications of Conserve SC Turf and Ornamental at 0.125 lb a.i./Acre to 10 acres in small, medium, and most large nurseries incorporating an Area Use Factor (AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

## Table PD/EP-E-Eco-1. to PD/EP-E-Eco-24.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

Table PD/EP-E-Eco-3. Chronic RQs associated with Application Scenario PD/EP-E-06: Foliar applications of Sevin SL at 1.02 lb a.i./Acre to 497 acres in a residential setting incorporating an Area Use Factor (AUF).

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

\* RQs provided are the total RQ for the applied pesticide product and any additives. For RQs of each active or inert ingredient and any ingredients of the additives refer to the **Dashboard Database**. RQs present in bold exceed the standard LOC and bold italics exceed the T&E LOC.

<sup>1</sup> Baseline- No Drift Buffer to Water or Habitat assumes exposure of terrestrial receptors is to the full application rate, and surface water is immediately adjacent to the application site.

<sup>2</sup> Reduced Exp.- 25 ft. Drift Buffer to Water assumes exposure of terrestrial receptors is to the full application rate, and reduced foliar spray estimated across a 100-ft. spray drift buffer to aquatic habitats.

<sup>3</sup> Reduced Exp.- 25 ft. Drift Buffer to Water and Habitat assumes exposure of is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water.

<sup>4</sup> Reduced Exp.- No Drift Buffer to Water, 25 ft. Drift Buffer to Habitat assumes exposure of terrestrial receptors is to reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats, and surface water is immediately adjacent to the application site.

<sup>5</sup> Reduced Exp.- No Residue to Water assumes no movement of either foliar applied pesticide to water, and exposure of terrestrial receptors is to the full application rate.

<sup>6</sup> Reduced Exp.- No Residue to Water, 25 ft. Drift Buffer to Habitat assumes no movement of foliar applied pesticide to water, and reduced foliar spray estimated across a 25-ft. spray drift buffer to terrestrial habitats.

Table PD/EP-E-Eco-23. Chronic RQs associated with Application Scenario PD/EP-E-03: Foliar applications of GF-120-Naturalyte Fruit Fly Bait at 0.000312 lb a.i./Acre to 31 acres in a residential setting incorporating an Area Use Factor (AUF).
