

Sound science needs to be part of the solution when making policy affecting agriculture and air quality, water quality. Our Universities have done a lot of research that is science based not politically based. There has been a lot money spent on research, lets not waste it. Also, please get the water quality control boards and the air quality control boards on the same page. Farmers have to spend money on three separate reports, one for the county, one for the state water board and one for the state air board, all three covering basically the same thing. I know this is asking a lot, but why can't we work towards making the process more efficient.

Remember that food is just as important as the military in national security along with energy.

Thank you for listening.
