

DATE: March 28, 2017
TO: All County Agricultural Commissioners
FROM: Plant Health and Pest Prevention Services
SUBJECT: **AQW Pest Report No. 09-2017**
Weekly AQW Report: For the week of February 23 to March 1, 2017

Attached is the report for all A, Q and W pests intercepted or detected in California from February 23 to March 1, 2017. Pests are identified by the California Department of Food and Agriculture's Plant Pest Diagnostics (PPD) Laboratory.

Los Angeles County Interception

PDRs: 190P06619861-9863 & 9865

On February 28, 2017, a team of Los Angeles County Inspectors including Sean Weston, Emmanuel Ofiabulu, Linda Khuu, and Greg Mason were on a routine high risk inspection at Hawaiian Air Cargo in Los Angeles. During the inspection, some suspect pests were found on lalot and taro leaves.

Pest samples were collected in alcohol and dry vials and submitted to the PPD Laboratory. Pests were identified as A-rated *Aleurodicus dispersus* (spiraling whitefly), A-rated *Kallitaxila granulata* (planthopper nymphs), Q-rated Pseudococcidae (immature female mealybugs), and Q-rated unidentified (arthropod insect eggs).

Notices of rejection were issued for violation of California Food and Agricultural Code (FAC) [Section 6461.5](#) (live pests). On March 1, the shipments were double-bagged and taken to the Sunshine Canyon Landfill in Sylmar for dumping and burial under the supervision of Inspector Greg Mason.

Tetranychid Mite Interception at Needles Station!

PDR: NE0P06654799

On February 15, 2017, a private vehicle traveling from Texas arrived at the Needles Border Protection Station. Inspector Tim Bennett initiated an inspection and the driver of the vehicle declared to have three outdoor plants.

Upon taking a closer look, Inspector Bennett noticed that the plants were infested with small insects. The plants were in violation of California FAC [Section 6461.5](#) (live pests) and as a result were confiscated by Inspector Bennett.

Specimens collected were submitted to the PPD Laboratory and were identified as Q-rated *Tetranychus* sp. (tetranychid mite). The plants were destroyed and disposed of at the station.

Family Tetranychidae^{1/}: “Spider mites (family: Tetranychidae) have a simple, oval-shaped body and no wings or antennae. All species pass through an egg stage, a six-legged larval stage, and two eight-legged nymphal stages (protonymph and deutonymph) before transforming into an eight-legged adult. Immature stages resemble the adults except in size. An adult female may live for several weeks and lay many dozens of eggs during her lifetime. Under optimum conditions, spider mites can complete their development from egg to adult in less than one week, so there may be many overlapping generations in a single season. Therefore, populations can increase rapidly and cause extensive plant damage in a very short time. Spider mites have needle-like mouthparts and feed by piercing the leaves of host plants and sucking out the fluids from individual plant cells. This causes the leaves to have a stippled or flecked appearance, with pale dots where the cellular contents have been removed. Prolonged, heavy infestations cause yellowing or bronzing of the foliage and premature leaf drop similar to drought stress. Severely-infested plants may be stunted or even killed. Most of the mites feed from the undersides of leaves, although the damage is most evident from the upper surface.”
