AQW PEST REPORT No. 38-2021

To: All County Agricultural Commissioners

Date: January 19, 2022

Place: Sacramento

Phone: (916) 654-0312

From: Plant Health and Pest Prevention Services

Subject: **AQW Pest Report No. 38-2021**

Weekly AQW Report: For the week of September 16 to September 22, 2021

Attached is the report for all A, Q, and W pests intercepted or detected in California from September 16 to September 22, 2021. Pests were identified by the California Department of Food and Agriculture's Plant Pest Diagnostics (PPD) Laboratory.

Several Pests Intercepted by Marin County Inspectors

PDRs: 210P50000148, 0149, 0152, 0153, & 0155

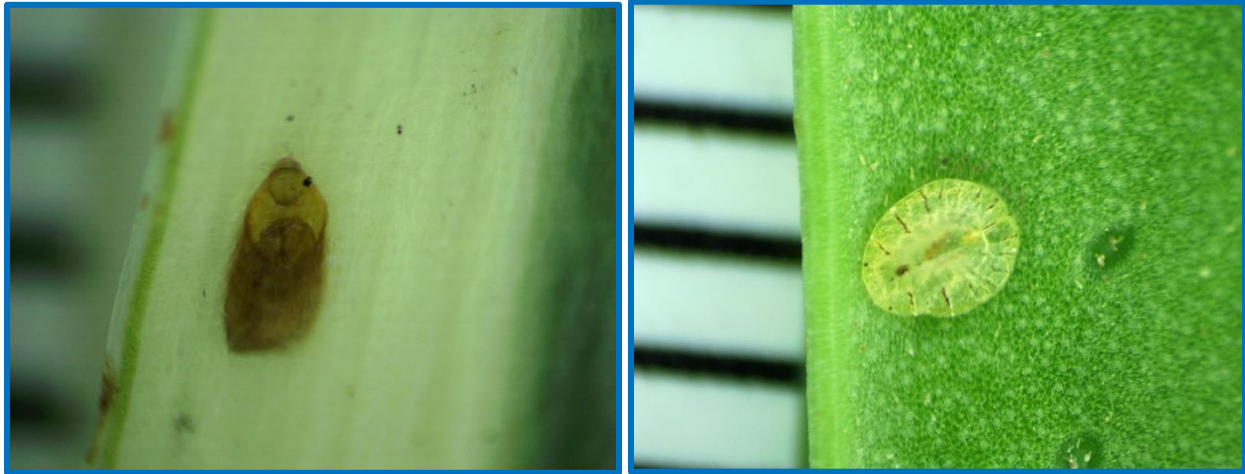

On September 15, 2021, Marin County Agricultural and Standards Inspector Christopher Cook conducted a routine inspection at the FedEx facility located in San Rafael. During the inspection, a properly marked and certified package containing a tropical floral bouquet was pulled for further investigation. The package was shipped by The Bouqs, an online floral retailer, whose package labeling indicated that the plant material inside originated in Ecuador. Inspector Cook opened the package for inspection and found the contents to be heavily infested with various types of insect pests, and associated plant damage on the foliage of the bouquet.

Pest samples were collected and sent to the PPD Entomology Laboratory where they were identified as the following:

A tropical floral bouquet from Ecuador shipped by The Bouqs. (Photo courtesy of Marin County.)

- A-rated *Parlatoria proteus* (sansevieria scale) PDR: 210P50000149
- A-rated *Selenaspidus articulatus* (rufous scale) PDR: 210P50000152
- A-rated *Pinnaspis buxi* (boxwood scale) PDR: 210P50000153
- A-rated *Milviscutulus mangiferae* (mango shield scale) PDR: 210P50000155
- Q-rated Tenuipalpidae PDR: 210P50000148
- Q-rated Coccidae (soft scale) PDR: 210P50000152

Left: A-rated *Parlatoria proteus* (sansevieria scale) found on foliage. Right: A-rated *Milviscutulus mangiferae* (mango shield scale) found on foliage (Photos courtesy of Marin County.)

A Notice of Rejection was issued for violating California Food and Agricultural Code (FAC) [Section 6461.5](#) (live pests). Due to these finds being federally actionable pests involving foreign origin material, Smuggling Interdiction and Trade Compliance (SITC) was notified. The infested bouquet and package were destroyed via incineration. This find represents the fifth package since August 2021 that Inspector Cook has intercepted from shipper The Bouqs, all of which contained plant material originating from Ecuador. The significant pests found in these interceptions add up to a total of 10 A-rated pests and 5 Q-rated pests.

Alameda County High Risk Interception

PDR: 010P50001826

On September 14, 2021, Alameda County Inspector Megdelawit Yoseph conducted an inspection of incoming parcels at the UPS facility in Hayward. During the inspection Inspector Yoseph intercepted an unmarked commercial shipment of approximately 30 *Annona squamosa* (sugar apple) fruit. The package was shipped from a possible fruit vendor with a Homestead, Florida return address. The shipment was confiscated for violating California FAC [Section 5306](#) (violation of a quarantine) due to the absence of proper certification to meet California State Exterior Quarantine for Caribbean Fruit Fly, California Code of Regulations (CCR) [Section 3252](#). Sugar apples from Florida are prohibited entry into California unless officially certified as treated at origin.

Upon detailed inspection of the fruits, Inspector Yoseph found several live suspect mealybugs. Pest samples were collected and submitted to the PPD Entomology Laboratory where they were identified as A-rated *Dysmicoccus texensis*.

A Notice of Rejection was issued for violating California FAC [Section 6461.5](#) (live pests), California FAC [Section 6421](#) (markings), and California FAC [Section 5306](#) (violation of a quarantine). The shipment of sugar apples was destroyed by freezing.

Confiscated commercial shipment of infested *Annona squamosa*. (Photos courtesy of Alameda County.)

Dysmicoccus texensis is a mealybug that is often found feeding on plant roots, where large populations prevent water and nutrient absorption, weaken plants, and reduce crop yields. *Dysmicoccus texensis* has never been found in the environment in California. Its entry to the state is likely to have significant economic and environmental impacts. *Dysmicoccus texensis* was intercepted 44 times by CDFA's Border Stations, Dog Team, and High-Risk programs between January 1, 2000 and December 31, 2014. The mealybug has been found on limes, grapefruit, bananas, bell peppers, sugar apple, and aerial parts of unidentified plants.

Host plants of *Dysmicoccus texensis* are commonly grown in California as both crops and ornamentals. *Dysmicoccus texensis* is known to feed on at least 24 species of plants in 13 families. Mealybugs have high reproductive rates and may be dispersed long distances by the movement of infested plants or fresh plant parts. They may also be dispersed locally by wind or by hitchhiking on clothing, equipment, or animals.

Source: [Dysmicoccus texensis \(Tinsley\): A Mealybug | Pest Rating Proposals and Final Ratings \(ca.gov\)](#)
