## Introduction

A synonymic list of the New World Odonata was published as vol. 3(2) of *Argia* on 15 June 1991 (digital scan available at Odonata Central; <[www.odonatacentral.org/](http://www.odonatacentral.org/)> under "Resources" tabs). Many nomenclatorial changes and synonymies have taken place since that list was published. This revised listing of the synonymic list (hereafter referred to as NWOL) includes additions and changes up through February 2016 and represents a complete listing for all described Odonata of North, Middle, and South America. Generic synonyms and *nomina nuda* are included when their identity is known (often through examination of labeled specimens). We do not recognize subgenera, but mention their names in the Comments section after the list. Species misidentifications are not included.

The following have been important catalog sources for this work:

Kirby, W.F. 1890. A synonymic catalogue of Neuroptera Odonata, or dragonflies. Gurney and Jackson, London, ix + 202 pp.

Bridges, Charles A. 1994. Catalogue of the family-group, genus-group and species group names of the Odonata of the world (third edition). Privately published by the author (now deceased).

Hämäläinen, M. 2016. Calopterygoidea of the world: A synonymic list of extant damselfly species of the superfamily Calopterygoidea (*sensu lato*) (Odonata: Zygoptera). Available at: <http://caloptera.com/catalogue.html>

The first two works and several other important references and monographs on Odonata can be found at the Biodiversity Heritage Library website (<http://www.biodiversitylibrary.org/>).

Keys to families and genera can be found in the following references:

Garrison, R.W., N. von Ellenrieder and J.A. Louton, 2006. The dragonfly genera (Odonata: Anisoptera) of the New World: An illustrated and annotated key. The Johns Hopkins University Press xiv + 368 pp. + 8 pls. (<http://www.press.jhu.edu/about/index.html>)

Garrison, R.W., N. von Ellenrieder and J.A. Louton, 2010. Damselfly genera of the New World. An Illustrated and Annotated Key to the Zygoptera. The Johns Hopkins University Press xiv + 490 pp. + 24 pls. (<http://www.press.jhu.edu/about/index.html>)

Classification of the Odonata has undergone significant changes in recent years as reflected in the following treatments:

Dijkstra, K-D. B., G. Bechly, S. M. Bybee, R. A. Dow, H. J. Dumont, G. Fleck, R. W. Garrison, M. Hämäläinen, V. J. Kalkman, H. Karube, M. L. May, A. G. Orr, D. R. Paulson, A. C. Rehn, G. Theishinger, J. W. H. Trueman, J. van Tol, N. von Ellenrieder & J. Ware. 2013. The classification and diversity of dragonflies and damselflies (Odonata). Zootaxa 3703(1):36-45. (available at: <http://www.mapress.com/zootaxa/taxa/Odonata.html>)

Dijkstra, K-D. B., V. J. Kalkman, R. A. Dow, F. R. Stoks & J. van Tol. 2013. Redefining the damselfly families: a comprehensive molecular phylogeny of Zygoptera (Odonata). Systematic Entomology (2013) DOI:10.1111/syen.12035 (available at: <http://onlinelibrary.wiley.com/doi/10.1111/syen.12035/abstract>)

Carle, F. L. , K. M. Kjer & M. May. 2015. A molecular phylogeny and classification of Anisoptera (Odonata). Arthropod Systematics & Phylogeny. 73(2): 281-301 (available at: [http://www.senckenberg.de/files/content/forschung/publikationen/arthropodsystematics/asp\\_73\\_2/04.asp\\_73\\_2\\_carle\\_281-301.pdf](http://www.senckenberg.de/files/content/forschung/publikationen/arthropodsystematics/asp_73_2/04.asp_73_2_carle_281-301.pdf))

We follow the classification suggested in the first paper, and our treatment of the Corduliidae and Synthemistidae largely follows Carle *et al* (2015). We consider the reclassification of Zygoptera based on molecular studies suggested in the second paper still preliminary and do not follow it yet pending confirmation by further studies.

In this synonymy we list the families following a phylogenetic sequence, and alphabetically within still unresolved polytomies. Generic synonyms are listed chronologically; species are listed alphabetically under genera, as are synonyms; subgenera are not listed. Taxa treated as synonyms are listed as they were originally cited. Thus the entry for *limbata* Se1ys, 1853, which was originally described as *Hetaerina tricolor* race *limbata*, is: syn *tricolor* race *limbata* Se1ys, 1853. A question mark before the name (*e.g.* ?*maxima* McLachlan, 1879) indicates that we consider the name a **probable** synonym, reflecting our own taxonomic views or those shared by colleagues (usually by letter or e-mail), which has not yet published; therefore, ***this list should not be considered a publication***. After the list, we provide annotations for some particular taxa justifying our opinions.

The abbreviations and letter fonts are defined as follows:

#### UPPER CASE BOLDFACED = ORDER, FAMILY

**Boldfaced** = Genus

***Boldfaced Italics*** = *species and subspecies*

*Italics* = *synonyms, homonyms*

**[Taxon]** = genus in which *species* was originally described

(Author, date) = *species* transferred from original **genus**

?*species* = synonymous status uncertain

We have sent earlier versions of the list to the following Odonatologists, who have freely given their advice, opinions, and constructive criticisms: J. Belle (The Netherlands), G. Bick (Florida), C. Cook (Kentucky), J. Daigle (Florida), J. De Marmels (Venezuela), T. Donnelly (New York), S. Dunkle (Texas), M. Hämäläinen (Finland), A. Machado (Brazil), P. Machet (France), K. Tennessen (Wisconsin), S. Tsuda (Japan), and J. van Tol (The Netherlands). However, we have not always followed the opinion of all of our colleagues regarding the establishment of certain genera or author citations, and those errors that remain are ours. We owe much appreciation to

the late Mr. Charles Bridges, of the University of Illinois at Urbana-Champaign, who corresponded with R. Garrison over past years regarding the status of many New World Odonata name changes, providing much help during the evolution of this list. To Don Frack of Covina, California, we owe a special debt. He provided us with a DBASE program, TAXON, which made the present list possible.

We have tried to be thorough in establishing correct authorship for each taxon, and we hope that any errors discovered will be addressed to us. Problems have confronted us for correct dates and authorship of various taxa and we have addressed most of these in the **Comments** section that follows the list. We hope that the list will prove helpful to others, especially in solving several vexing problems that remain unsettled.

## A SYNONYMIC LIST OF THE NEW WORLD ODONATA

### **ODONATA** Fabricius, 1793

Suborder: ZYGOPTERA Selys, 1854

#### **LESTIDAE** Calvert, 1901

## Comments

**Comments regarding dates of publication:**

**1.** Palisot de Beauvois's description of *Agrion maculatum* in: 'Insectes receuillis en Afrique et en Amérique, dans les royaumes d'Oware et de Benin, a Saint-Domingue et dans les États-Unis, pendant les années 1786–1797. Levrault, Schoell et Cie Paris. xvi + 276 p., 90 pls.'

Although 1805 is commonly cited as the publication date for *Agrion maculatum* Palisot de Beauvois, the description of this species is on page 85 of that work which, according to Evenhuis (1997. *Litteratura Taxonomica Dipterorum* 1758–1930. Being a selected list of the books and prints of Diptera taxonomy from the beginning of Linnaean Zoological Nomenclature to the end of the year 1930; containing information on the biographies, bibliographies, types, collections, and patronymic genera of the authors listed in this work including detailed information on publication dates, original and subsequent editions, and other ancillary data concerning the publications listed herein. Volume II. L–Z. Backhuys publishers, Leiden, p. 588) was published in livraison 5 in September, 1807. The correct name and author citation is therefore *Calopteryx maculata* (Palisot, 1807).

**2.** Hoffmannsegg as author in: 'Burmeister, H.C.C., 1839. Handbuch der Entomologie. 2(2). Neuroptera. T.C.F. Enslin: 757-1050', and in 'Erichson, W.F., 1848. Insekten, pp. 583–586. In R. Schomburgk: Reisen in Britisch-Guiana in den Jahren 1840-1844. Dritter Thei. Versuch einer Fauna und Flora von Britisch-Guiana J. J. Weber, Leipzig.'

Hoffmannsegg is mentioned after the species name for the following odonate taxa in the two publications referred above as follows:

'*Libellula imbuta* Hoffmfgg.', in Burmeister 1839: 850

'*L[ibellula]. bicolor* Hoffgg.', in Erichson 1848: 583

'*L[ibellula]. guttata* Hoffgg.', in Erichson 1848: 584

'*Lestes tricolor* Hoffgg.', in Erichson 1848: 585

Therefore, it could be argued that all of these names should be ascribed to Hoffmannsegg since his name is mentioned after those species names.

Article 50.1.1 of the fourth edition of the International Code of Zoological Nomenclature states that "...if it is clear from the contents that some person other than an author of the work is alone responsible both for the name or act and for satisfying the criteria of availability other than actual publication, then that other person is the author of the name or act."

However, we do not think that the contents give any indication of Hoffmannsegg as responsible for the descriptions in either of these two works.

We agree with Calvert (Calvert, P.P., 1898. Burmeister's types of Odonata. Transactions of the American Entomological Society 25: 64) in attributing authorship of *imbuta* to Burmeister, since Hoffmannsegg is mentioned along with several other collection sources in the "Vorrede" of Burmeister (1839) with the explicit indication that the source of the material will be mentioned. Therefore, the species names followed by "Hoffgg." simply indicate that the material used for the descriptions by Burmeister came from Hoffmannsegg's collection.

Several other species of insects described in Schomburgk (*Hippopsis dasycera* [Coleoptera: Cerambycidae], *Dorypbora annulata*, *Diabrotica augulicollis* [Coleoptera: Chrysomelidae], *Emesis monostigma* [Lepidoptera: Riodinidae], *Syrichthus festiva* [Lepidoptera: Hesperiidae], *Augocoris gomesii* [Hemiptera: Scutellaridae], *Edessa helix*, *Edessa moschus* [Hemiptera: Pentatomidae], *Spartocera (Sephina) pubera* [Hemiptera: Coreidae]) are followed by "Hoffgg.",

yet none of the recent catalogs on these respective insect groups attribute authorship to Hoffmannsegg. Some of these names are appended with the notation "Hoffgg. i. mus" possibly meaning "in museum Hoffmannsegg."

Since no other mention of Hoffmannsegg appears anywhere in Schomburgk's introduction, who explicitly acknowledged the contributions of other authors ("....Dieser schwache Versuch der Zusammenstellung der Fauna von Britisch-Guiana würde unterblieben sein, wenn mir nicht auch hier Männer wie Johannes Müller, Ehreisberg, Erichson, Troschel und Cabanis durch die Mittheilung ihrer Untersuchungen, durch ihre anregende Aufforderung die Möglichkeit gegeben hätten, zu dem, was sie für die Wissenschaft gethan, meine spärlichen zoologischen Beobachtungen und Erfahrungen hinzu zu fügen—um so einem späterem, kenntnissreichern Reisenden wenigstens das Gerippe für eine erschöpfende, systematische Bearbeitung der Fauna geben zu können..."), we believe that the first portion of Article 50.1.1 can be invoked to attribute authorship for all new odonate taxa in Schomburgk to Erichson rather than to Hoffmannsegg. Hoffmannsegg probably acted as the source of material, and he may have provided manuscript names for these taxa, but he was not responsible for the descriptions.

All of these taxa have traditionally been credited to Burmeister (*Libellula imbuta*) or Erichson in Schomburgk (*Libellula bicolor*, *Libellula guttata*, *Lestes tricolor*), authorship attributions with which we concur.

### **3. Say's Descriptions of new North American neuropterous insects, and observations on some already described:**

According to Nolan (Nolan, E.J. [Editor]. 1913. An index to the scientific contents of the Journal of the Academy of Natural Sciences of Philadelphia. 1812-1912. Philadelphia Academy of Natural Sciences xiv + 1419 pp), the official publication date for Say's paper is 5 May 1840, as was correctly stated by Johnson (Johnson, C. 1973. Variability, distribution and taxonomy of *Calopteryx dimidiata* (Zygoptera: Calopterygidae). Florida Entomologist 56(3): 207-222).

Given the change of dates for Say's paper, three names *Epophthalmia cinnamomea* Burmeister, 1839, *Epophthalmia lateralis* Burmeister, 1839 and *Libellula polysticta* Burmeister, 1839 would be senior synonyms of three North American species: *Libellula transversa* Say, 1840, *Libellula cynosura* Say, 1840 and *Libellula obsoleta* Say, 1840 respectively. However, Burmeister's names have not been in use for well over 100 years and we consider the correct names for these three to be *Didymops transversa* (Say, 1840) *Epitheca cynosura* (Say, 1840) and *Neurocordulia obsoleta* (Say, 1840) in accordance with Article 23.9.1.2 of the International Code of Zoological Nomenclature.

### **4. Walsh, B.D. Observations on certain N.A. Neuroptera. Proceedings of the Entomological Society of Philadelphia. 2: 167-272:**

The running head for this paper states "[October 1863]" but the title page for Volume II. states 1864. According to Brown (Brown, F. M. 1964. Dates of publication of the various parts of the Proceedings of the Entomological Society of Philadelphia. Transactions of the American Entomological Society 89: 305-308), the earliest published date associated with Walsh's paper is 27 January 1864.

### **5. Hagen and Selys, Monographie des Gomphines:**

We follow Calvert (1905. *Biologia Centrali-Americanica*: 148), who states in a footnote: "It is usual to quote the "Monographie des Gomphines" with the date 1857, as is done by Kirby [1890] for example, and "November 1857" is, indeed, that which appears on the title page of the volume; but the original paper cover bore the date "Mai 1858," which has usually not been preserved in bound copies. Moreover, plates xx-xxii are dated at the bottom as having been drawn in 1858." Cowley (1937. *J. Soc. Bibliography Nat. Hist.* 1(3):73-74) opted for 1857, but further evidence of an 1858 publication date was brought to our attention by P. Machet. In the "appendice" (page 651 [391 separate]) it is stated: "Some circumstances having put off the conclusions of this volume, considerable and rather numerous materials have reached us *during printing* [italics ours]. One comes from a trip made by H. Hagen to London in 1857; others from a shipment of species from Texas, made by the Smithsonian Institution."

**6.** Hagen's Synopsis of the Odonata of America in the Proceedings of the Boston Society of Natural History 18(1): 20-96:

Although this paper is usually cited 1875 as given in the running head, the title page of this volume gives 1877, the title page says "Proc. of the Boston.....Soc.....papers presented during the years 1875 and 1876 and at the bottom of this page is stated Printed for the Society by....., 1877." Hagen's paper was read before the society in 1875 but was published in 1877.

**7.** Selys-Longchamps, Edm. de. Diagnose de deux espèces nouvelles de Calopterygines de Panama. *Comptes-rendus de la Société Entomologique de Belgique* 21: xxi (1-2 separate):

Although Selys' brief Panama paper is stated on the masthead to have been read at the meeting of 2 February 1878, Selys (1879. Quatrièmes additions au synopsis des Caloptérygines. *Bulletin de l'Académie royale de Belgique* (2)47: 349-409 [1-63 reprint]) gives 1878 for *Hetaerina fuscoguttata* (p. 367 [21 reprint]) but 1879 for *Cora semiopaca* (p. 408 [62 reprint]). Since the volume includes a report of a meeting as late as 26 December 1878, a publication date of February 1879 makes sense. Thus, Selys presented his paper describing *Hetaerina fuscoguttata* and *Cora semiopaca* at a meeting on 2 February 1878, but it was not published until early 1879.

**8.** Date of publication of May, M.L., 1992. A review of the genus *Neocordulia*, with a description of *Mesocordulia* subgen. nov. and of *Neocordulia griphus* spec. nov. from Central America, and a note on *Lauromacromia* (Odonata: Corduliidae). *Folia Entomológica Mexicana* 82: 17-67.

Although 1991 is cited as the publication date on the header, the volume was not actually published until the following year (M. May, *pers. comm.*). Thus, the correct date for *Neocordulia griphus* May is 1992.

### Specific Comments:

**9.** *Hetaerina sanguinea* ab. *brevistyla* Selys, 1879 is an infrasubspecific taxon and is therefore not available for purposes of nomenclature.

**10.** *Euthore fasciata* form *sulphurata* De Marmels, 1982 is an infrasubspecific taxon and is therefore not available for purposes of nomenclature.

**11.** Machado (2012. The *apicale* species group of *Acanthagrion* with description of four new species and a hook-moving apparatus (Zygoptera: Coenagrionidae). *Odonatologica* 41(3): 201-

223) revised members of the *A. apicale*-group and raised *A. apicale descendens* Fraser, 1942 to specific status and described three new species, *A. chicomendesi*, *A. kaori*, and *A. triangulare*, all based on minute differences in male genital ligula morphology. We believe these differences represent an inaccurate rendition of the genital ligula (*A. apicale descendens*), postmortem and/or slight differences in geographic variation and, accordingly, we consider all four to represent synonyms of the oldest name, *A. apicale* Selys 1876.

**12. *Acanthagrion leonardi***, according to G. Jurzitza (*in litt.* 27 Feb. 1996) is a junior synonym of *A. cuyabae* Calvert.

**13.** Machado & Lencioni (2011. *Austrotepuibasis* gen. nov., with descriptions of three new species from Brazil (Zygoptera: Coenagrionidae. *Odonatologica* 40(1): 27-37) erected a new genus, *Austrotepuibasis* (type species: *Austrotepuibasis demarmelsi* Machado & Lencioni, 2011 [by original designation]) for three new species: *A. alvarengai*, *A. demarmelsi*, and *A. manolisi*, based primarily on differences in genital ligula structure (absence of sclerotized auricle process on apical segment, two pairs of lateral lobes, pair of long terminal filaments), slight differences in abdominal coloration, and posterior margin of female S10 entire. We have examined examples of some of these new species and they do have a sclerotized auricular structure and a deeply cleft S10 in the female—both characters shared with *Tepuibasis*. These similarities plus others listed overlap considerably with known specimens of *Tepuibasis* we examined, rendering the genus *Austrotepuibasis* indefinable on morphological grounds. Possession of long terminal filaments in the genital ligula and occurrence in lower Amazon forest regions in Brazil do not, in our opinion, warrant erection of a new genus for these three species. Accordingly, we consider *Austrotepuibasis* a junior synonym of *Tepuibasis*.

**14. *Mecistogaster marchali* var. *selysia*** Navás has been examined by Machet, who informed us that it is a synonym of *M. modesta*.

**15. *Aeshna clepsydra*** with synonyms *arundinacea* Selys 1872 and *maxima* Heikel *in* Hisinger 1861. The latter two names have often been included as synonyms of *A. clepsydra*. Our reason for their deletion is based on a footnote by Walker to Muttkowski (1910. Cat. Odon.: 109):

"Walker in litteris Aug. 14, 1909: 'The synonyms given by you do not belong to the true clepsydra. *A. arundinacea* and *maxima* I have not seen: It is very probable that the first at least is a good species.'" And, "Walker in litteris, Sept. 24, 1909: 'Some of the references ... do not refer to true clepsydra...I am quite sure *arundinacea* is not clepsydra, but as I have not seen the type it is probably best to let it stand as a synonym of the latter on the authority of Martin'."

Curiously, we can find no mention of these little-used names in Walker's 1912 monograph. The original description of *arundinacea* is based on a female from "Irkutzk", and Selys states it is similar to Siberian *A. juncea*. According to Dr. Matti Hämäläinen, University of Helsinki, *A. maxima*, described from specimens from Finland (Hämäläinen, M. 2008. Ukonkorennot *crenata* ja *maxima* - hieman historiaa. Suomen Sudenkorentoseuran julkaisuja – Crenata 1: 35-37) is a junior synonym of the Old World *Aeshna crenata* Hagen. We have found no records of *clepsydra* occurring anywhere in the Palearctic, and we strongly suspect that *arundinacea* refers to a species other than the North American *clepsydra* (see: Valle, K.J. 1921. Zur Kenntnis der Odonatenfauna Finlands II. Die Finnischen Arten der *Aeschna crenata*-Gruppe und ihre Deutung. Acta Societis pro Fauna et Flora Fennica 48(4): 1-28).

**16.** *Anomalophlebia nitida* Belle, 1995. This name was applied to a single female from Venezuela. Garrison, von Ellenrieder & Louton (2010. Damselfly genera of the New World. An illustrated and annotated key to the Zygoptera. The Johns Hopkins University Press, page 399) mentioned a probable synonymy of this name with *Desmogomphus tigriventris* Williamson, 1920 based on correspondence with J. De Marmels. This name was later formally synonymized by De Marmels ("2007" [2010] Reportes de Odonata nuevos para Venezuela. Entomotropica 22(1): 45-47).

**17.** Both Dr. Ken Tennessen and Mr. Carl Cook informed us that *Neurocordulia clara* Muttkowski is closely related to *N. molesta*, although Cook believes *N. clara* a good species. We have treated it as a synonym of *N. molesta*.

**18.** Dr. Ken Tennessen (*in litt.*) informed us that he believes *Epitheca williamsoni* Muttkowski is a probable synonym of *E. costalis*.

**19.** *Erythrodiplax bromeliicola*. *Diplax fraterna* Hagen, 1873 was introduced as a *nomen nudum* and this name, mentioned in various listings pertinent to the Antillean odonate fauna, was made available by Ris (Ris, F., 1911. Collections Zoologiques du Baron Edm. de Selys Longchamps. Catalogue systématique et descriptif. Libellulinen 4. 12: 385-528) in his key to the forms of *E. connata* (1911: 498-499) and description (1911: 508-509) of material housed in the Selys collection. Although the name *fraterna* has been listed as a junior synonym of *E. connata*, the latter species is not presently known to occur in Cuba. Based on Ris' key and description, *E. connata fraterna* Ris is apparently an older name for *E. bromeliicola* Westfall in Needham, Westfall & May, 2000. However the name *fraterna* has not been in use (except in catalogs and various listings) since 1911 and we have preserved the name *bromeliicola* in accordance with Article 23.9.1.2 of the International Code of Zoological Nomenclature.

**20.** *Erythrodiplax corallina*. The late Dr. Gerhard Jurzitz had informed us (*in litt.*) that the description of Navás' *Sympetrum medium* unquestionably refers to *E. corallina*.

**21.** Philippe Machet (*in litt.*) believes that *Nadiplax diversa* Navás may actually be an *Erythrodiplax*, and possibly a synonym of a later described species.

**22.** *Libellula bifasciata* Blanchard. The type for this old, forgotten name was discovered by Lieftinck to be *L. semifasciata*, not *L. pulchella*, according to Dr. M.J. Westfall, Jr. (*pers. comm.*). We think it best to consider *L. bifasciata* a *nomen oblitum*.

**23.** P. Machet (*in litt.*) informed us that *Macrothemis rochae* is a probable synonym of *M. inacuta*.

**24.** P. Machet (*in litt.*), who has examined the types of *Dythemis flavopunctata* and *Brechmorhoga flavoannulata*, considers them synonyms. The species is presently considered a *Brechmorhoga*.

**25.** P. Machet (*in litt.*), believes *Macrothemis valida* Navás to be a *Brechmorhoga*.

#### Status of specific names not mentioned in the NWOL:

**25.** *Enallagma optimolocus* Miller & Ivae 1996. We strongly believe that this taxon is only a hybrid between *E. anna* and *E. carunculatum* for the following reasons: No females of *E. optimolocus* have been collected and this "species" has always been collected where the two

parental types occur. Examination of two paratypes and the Oregon male, the last kindly loaned to RWG by Dr. Ken Tennessen, show appendage morphology intermediate between the parental types. Hybridization between other *Enallagma* species is known and hybrids intermediate in appendage morphology have been produced in the laboratory and occur in nature for two closely related species, *Ischnura denticollis* and *I. gemina*.

**26. *Skiallagma baueri*** Förster, 1906. Examination of a syntype male from the University of Michigan, Ann Arbor, shows this taxon to be a junior synonym of *Xiphagrion cyanomelas* Selys 1876, a Paleotropical species (Garrison, R.W., 2012). *Skiallagma baueri* Förster 1906, a geographically misplaced damselfly, is a junior synonym of *Xiphagrion cyanomelas* Selys 1876 (Odonata: Coenagrionidae). Zootaxa 3514: 84–88.). Consequently, *Skiallagma baueri* is deleted from the New World List.

**27. *Sobobapteron kirkbyae*** Pierce 1965. This species was described (Pierce, W. D. 1965. Fossil arthropods of California 26. Three new fossil insect sites in California. Bulletin Southern California Academy of Sciences. 64(3):157-162) from a wingtip supposedly of Permian origin. According to a later paper by Carpenter (Carpenter, F. M. 1968. The affinities of the genus *Sobobapteron* Pierce. Bulletin Southern California Academy of Sciences. 67(4):263-264), the wing which appears to be of Pleistocene origin, is apparently that of an extant *Enallagma* species. Mrs. L. K. Gloyd in correspondence with Carpenter was "of the opinion that the fossil wing could very well have belonged to *Enallagma clausum* Morse, which now occurs in California...". It is presently impossible to associate this fossil with any extant species (if it does represent an extant species). We will continue to consider *Sobobapteron* as a synonym of *Enallagma*, but the status of the species *kirkbyae* will remain unclear until further evidence showing it to be a synonym of a recent species in *Enallagma* is forthcoming.

**28. *Ophiogomphus? menetriessii*** Selys, 1854. The status of this name was discussed by Garrison (1994. A revision of the New World genus *Erpetogomphus* Hagen in Selys (Odonata: Gomphidae). Tijdschrift voor Entomologie 137:173-269), who argued that it should be considered a *nomen dubium*.

**29. *Gomphus williamsoni*** Muttkowski, 1910. The name refers to a single specimen which is most likely a hybrid between *Gomphus graslinellus* and *G. lividus* (Needham, Westfall & May, 2000. Dragonflies of North America. Revised Edition. Scientific Publishers, Inc. xv + 939 pp.).

**30. *Mitragomphus ganzanus*** Needham, 1944. Comparison of the detailed illustrations of the accessory genitalia in Garrison *et al.* (Garrison, R.W., N. von Ellenrieder and J.A. Louton, 2006. The dragonfly genera (Odonata: Anisoptera) of the New World: An illustrated and annotated key. The Johns Hopkins University Press, p. 114), and photos of the holotype and only known specimen show it to represent *Gomphidia kirschii* Selys, 1878, a species endemic to the Philippines. The species is discussed in: Garrison, R. W., K-D. B. Dijkstra, M. Hämäläinen & R. J. T. Villanueva. 2015. *Mitragomphus ganzanus* Needham, 1944, a geographically misplaced dragonfly, is a junior synonym of *Gomphidia kirschii* Selys, 1878 (Odonata: Gomphidae), Zootaxa 3911 (2): 280–286.

**31. *Macromia wabashensis*** Williamson, 1909. Until recently, consensus among most U.S. Odonatologists was to treat *Macromia wabashensis* as a synonym or color form (polymorph) of *M. taeniolata*. Secondary genitalia including the shape of the tip of the hamule for *M. pacifica*, *M. wabashensis*, and *M. taeniolata* is similar. Williamson (1909 Proc. U. S. Nat. Museum 37:

369-398.) reports captures of *M. wabashensis* with *Macromia taeniolata* and *M. pacifica*, which suggests the possibility that *M. wabashensis* is a hybrid between *M. pacifica* and *M. taeniolata*. Other mostly non-published data suggest the occurrence of both *M. pacifica* and *M. taeniolata* wherever *M. wabashensis* has been collected. Like Dunkle (1995. Conservation of dragonflies (Odonata) and their habitats in North America. page 23 in Corbet, P. S., S. W. Dunkle, H. Ubukata, eds. Proceedings of the International symposium on the conservation of dragonflies and their habitats. Japanese Society for the Preservation of Birds, Kushiro, xii + 1-70), we are doubtful of according species status to *M. wabashensis*. Acquisition of more specimens and the discovery of the female may help to determine its true status. We suggest that multivariate morphometric analyses of available specimens of *M. wabashensis* and samples of *M. taeniolata* and *M. pacifica* from zones of sympatry with *M. wabashensis* may provide evidence about whether *M. wabashensis* is a hybrid.

#### **Subgeneric names not mentioned in the NWOL:**

32. Suggested as subgenera of *Aeshna*, now *Rhionaeschna*: *Hesperaschna* (Cockerell, 1913); *Marmaraeschna* (Calvert, 1952); *Schizuraeschna* (Calvert, 1952).
33. Suggested as subgenera of *Gomphus*: *Gomphurus* Needham, 1901; *Hylogomphus* Needham, Westfall & May, 2000.
34. Suggested as subgenera of *Epitheca*: *Epicordulia* Selys, 1871; *Tetragoneuria* Burmeister, 1839.
35. Suggested as subgenus of *Neocordulia*: *Mesocordulia* May, 1992.
